1. This office action is in response to the RCE filed on 6/26/08.
2. Response to Applicant's Arguments: On pages 9 and 10, the applicant stated:

Neither the Shiiyama reference or the Burns reference taken alone or in combination teach at least the features of Claim 6 of "determining, among attribute information of remaining image data units other than the first image data unit, whether attribute information in terms of pan angles, tilt angles, and zoom angles of a camera being used during capturing the remaining image data units is identical to the attribute information of the first image data unit in terms of pan angles, tilt angles, and zoom angles of a camera being used during capturing the first image data unit" and "deciding, among remaining image data units other than the first image data unit, images having the attribute information identical to the attribute information of the first image data units determined, as a second image data unit to be compared with the first image data unit in the measuring similarity index."

The examiner agrees and the examiner will withdraw Shiiyama and Burns reference.

3. Reason for Allowance

Claims 3, 5, 6, 9, 11 and 12 are allowable. The following is an examiner's statement of reasons for allowance:

With regards to claim 6, the examiner cannot find any applicable prior art disclosing determining among attribute information of remaining image data units other than the first image data unit, whether attribute information in terms of pan angles, tilt angles, and zoom angles of a camera being used during capturing the remaining image data units is identical to the attribute information of the first image data unit in terms of pan angles, tilt angles and zoom angles of a camera being used during capturing the first image data unit and deciding, among remaining image data units other than the first

image data unit, images having the attribute information identical to the attribute information of the first image data units determined, as a second image data unit to be compared with the first image data unit in the measuring similar index in combination with the rest of the limitations of claim 6.

Koike (US pat no 6,181,805): Koike discloses image of an object or objects belonging to either one of a predetermined number of categories (L kinds) to be recognized are previously taken by a camera or cameras from a plurality of predetermined M direction (see figure 1, apparatus 100, element 101 obtains M images in different directions, figure 2), and a region of object to be recognized is extracted from each image, and N dictionary images representative of the directions and categories are generated from the images, and the dictionary images are stored in dictionary image generating means together with the directions or orientations of the object (see figure 2). When a test image of an object to be analyzed is given, the degree of similarity or resemblance $r(n,X,Y)$ to the n th dictionary image ($n=1,2,\dots,N$) at matching position (X,Y) in the test image is computed by matching means, and this matching process is performed with (X,Y) and n varied, and the position (X_{\max},Y_{\max}) where the degree of similarity $r(n,X,Y)$ thereof becomes the highest is outputted as a region corresponding to the object region (figure 1, 107 and see column 2, lines 20-38).

The difference between Koike and the current invention is Koide computes the degrees of similarity between facial region image in the test image and the dictionary images for

output to the decision section, wherein decision section outputs a result the category represented by the dictionary image exhibiting a maximal degree of similarity.

The current invention determines among attribute information of remaining image data units other than the first image data unit, whether attribute information in terms of pan angles, tilt angles, and zoom angles of a camera being used during capturing the remaining image data units is *identical* to the attribute information of the first image data unit in terms of pan angles, tilt angles and zoom angles of a camera being used during capturing the first image data unit, then measures the similarity between a region in a first image and a specified corresponding region in the second image.

In short, the current invention determines whether the first image is identical to a second image in pan/tilt/zoom angles, then it performs similarity measures and Koide determine match between first and second image using similarity measure. The examiner cannot find any suggestions determining whether first and second image are identical in pan/tilt/zoom angles first then performs similarity afterwards.

Any comments considered necessary by applicant must be submitted no later than the payment of the issue fee and, to avoid processing delays, should preferably accompany the issue fee. Such submissions should be clearly labeled "Comments on Statement of Reasons for Allowance."
